TAPE MEASURE

SHARP SCISSORS

Pipe Cover Installation

1. Prep Your Pipe

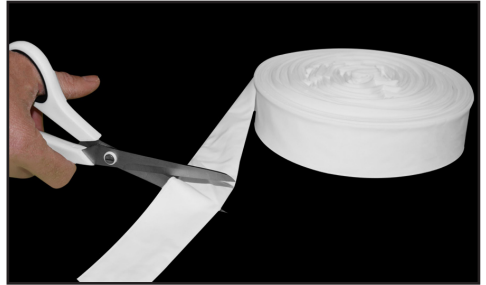

Prior to installation, inspect your pipe for any dirty spots or metal burrs that could potentially stain or snag the fabric. Consider prepping the pipe by cleaning and filing or taping over any burrs as needed.

2. Cut Your Cover

Lay out your Pipe Cover on a clean surface and use sharp scissors to cut the fabric approximately 2% longer than the segment of pipe you're covering.

For example, if you want to cover a 120" section of pipe,

you would multiply 120" by 1.02 to get 122.4". This is now the measurement you would cut to adequately cover your 120" section of pipe.

3. Flip Your Cover

To protect the fabric from damage, Pipe Cover Covers are sewn and shipped inside out. Once your Pipe Cover segment is cut to the length you need, flip it right side out and pull over the pipe like a sock.
